TABLE 3 Structures and molecular weights of predicted petrobactin components present in individual *asbA* to *-F* knockout mutants^a

Petrobactin Component	Description	Truncated Product (of <i>asb</i> mutants)	Size (MolWt)
	3,4-DHB	$\Delta asbC, \Delta asbD, \Delta asbE$ (AsbC-E facilitate 3,4-DHB and spermidine condensation)	154.12
	Spermidine	-	131.22
	Citrate	-	192.12
	3,4-DHB + Spermidine	-	281.36
	Spermidine + Citrate	-	319.36
	3,4-DHB + Spermidine + Citrate	$\Delta asbB$ (AsbB condenses spermidine to citrate, required for condensation of second spermidine)	455.46
	2(Spermidine) + Citrate	$\Delta asbC, \Delta asbD, \Delta asbE$ (AsbC-E facilitate 3,4-DHB and spermidine condensation) & $\Delta asbF$ (3,4-DHB synthesis)	446.59
	3,4-DHB + 2(Spermidine) + Citrate	-	582.7
	Petrobactin	$\Delta asbA$ (AsbB is redundant for AsbA, which condenses citrate to spermidine)	718.81
-	Bacillibactin	-	881.25
